

# You can't get the staff - an electronic alternative...

(an introduction to xia2)

Graeme Winter

Diamond Light Source

CCP4 Study Weekend 2012

# Overview

- Background
- What is xia2?
- What does it do and how do I use it?
- What decisions does it make?
- Conclusions / summary

# Before we start...

- No MOSFLM<sup>1</sup>, XDS<sup>2</sup>, SCALA<sup>3</sup>, CCP4<sup>4</sup>
- → no xia2
- No LABELIT<sup>5</sup>, CCTBX<sup>6</sup>, POINTLESS<sup>7</sup>, etc.
- → harder to write xia2, less reliable

- *Also told that this is impossible and a waste of time*

# What is xia2?

# What is xia2?

# What is xia2?

# What is xia2?

# What is xia2?

→  $HKLI\sigma_I$

# What is xia2?

- An *expert* system to perform diffraction data and processing on your behalf using your software

# What is xia2?

- An *expert* system to perform diffraction data and processing on your behalf using your software
- A system which can correctly handle multi-pass, multi-wavelength data sets

# What is xia2?

- An *expert* system to perform diffraction data and processing on your behalf using your software
- A system which can correctly handle multi-pass, multi-wavelength data sets
- *Not* a data processing package

# Why “you can’t get the staff?”

- 12 datasets / hour possible
- Limited help
- Human endurance
- Intended xia2 as tool to delegate data processing to

# Why “you can’t get the staff?”

- 12 datasets / hour possible
- Limited help
- Human endurance
- Intended xia2 as tool to delegate data processing to

# Why is this useful?

- Second opinion
- Allows you to focus on problem cases
- Help busy / novice users
- Provides access to other tools
- Reproducible processing

## Using xia2

# Options (1)

- -atom X - tell xia2 to separate anomalous pairs
- -2d - tell xia2 to use MOSFLM and SCALA
- -3d - tell xia2 to use XDS and XSCALE
- -3dii - tell xia2 to use XDS and XSCALE, indexing with all images

# How does it figure what to do?

- Read all of the image headers then

# How does it figure what to do?

- Read all of the image headers then
- Organise these into sweeps then

# How does it figure what to do?

- Read all of the image headers then
- Organise these into sweeps then
- Organise these into wavelengths then

# How does it figure what to do?

- Read all of the image headers then
- Organise these into sweeps then
- Organise these into wavelengths then
- Assign all of these wavelengths to a crystal

How does it figure what to do?

How does it figure what to do?

# How does it figure what to do?

# How does it figure what to do?

# What the program sees (automatic.xinfo)

```
BEGIN PROJECT AUTOMATIC
BEGIN CRYSTAL DEFAULT
BEGIN HA_INFO
ATOM Ba
END HA_INFO
BEGIN WAVELENGTH SAD
WAVELENGTH 0.979500
END WAVELENGTH SAD
BEGIN SWEEP SWEEP1
WAVELENGTH SAD

IMAGE K5_M1S3_3_001.img
START_END 1 450
END SWEEP SWEEP1
END CRYSTAL DEFAULT
END PROJECT AUTOMATIC
```

# Understanding the experiment

- SWEEP: one “scan” - basic unit of indexing / integration
- WAVELENGTH: container of SWEEPs
- WAVELENGTH: all H K L observations merged
- WAVELENGTH: CCP4 MTZ dataset
- CRYSTAL: contains WAVELENGTHs
- CRYSTAL: all data - basic unit of scaling

## Example: 3QRN<sup>8</sup>

- Data recorded at Diamond I02
- DNA / ligand complex
- Demonstrates:
  - Radiation damage
  - Heavy atom
  - Resolution limits
- Better sample used for deposition

---

<sup>8</sup>J.P. Hall et al., Proc. Natl. Acad. Sci. USA 2011 108 (43) 17573-17574

## Example command line

```
xia2 -3d -atom Ba /dls/i02/data/...
```

# Output

- xia2.txt: everything you should read - including program citations
- xia2-debug.txt: everything you probably shouldn't
- LogFiles: you should look at these
- DataFiles: MTZ + ersatz scalepack

## Example results

High resolution limit	1.25	6.45	1.25
Low resolution limit	18.85	18.85	1.27
Completeness	95.2	60.1	70.2
Multiplicity	12.2	8.4	4.8
I/sigma	12.3	18.5	2.6
Rmerge	0.113	0.096	0.564
Rmeas(I)	0.129	0.118	0.633
Rmeas(I+/-)	0.121	0.105	0.679
Rpim(I)	0.034	0.038	0.267
Rpim(I+/-)	0.043	0.041	0.368
Wilson B factor	12.131		
Anomalous completeness	93.3	52.6	58.0
Anomalous multiplicity	6.4	5.0	2.0
Anomalous correlation	0.544	0.791	-0.297
Anomalous slope	1.085	0.000	0.000
Total observations	118588	529	1634
Total unique	9749	63	337

## Example command line (I cheated, I like AIMLESS)

xia2 -3da ...

# LogFiles/\*aimless.log

# What to do next?

- Edit automatic.xinfo
- Only process first 200 frames

# Modify automatic.xinfo → modified.xinfo

```
BEGIN PROJECT AUTOMATIC
BEGIN CRYSTAL DEFAULT
BEGIN HA_INFO
ATOM Ba
END HA_INFO
BEGIN WAVELENGTH SAD
WAVELENGTH 0.979500
END WAVELENGTH SAD
BEGIN SWEEP SWEEP1
WAVELENGTH SAD
DIRECTORY /dls/i02/data/2011/mx1234-5
IMAGE K5_M1S3_3_001.img
START_END 1 200 ! THIS WAS 450
END SWEEP SWEEP1
END CRYSTAL DEFAULT
END PROJECT AUTOMATIC
```

Running again

```
xia2 -3d -xinfo modified.xinfo
```

## Example results II

High resolution limit	1.22	6.34	1.22
Low resolution limit	19.62	19.62	1.24
Completeness	86.9	49.1	37.8
Multiplicity	5.3	4.9	1.7

Anomalous correlation	0.779	0.931	0.000
Anomalous slope	1.553	0.000	0.000
Total observations	50875	272	342
Total unique	9552	55	199

# Resolution

- Data incomplete at high resolution
- Add RESOLUTION to xinfo file (in either SWEEP or WAVELENGTH
- Add -resolution to the command line

## Options (2)

- -xinfo modified.xinfo - use specific input file
- -image /path/to/an/image.img - process specific scan
- -spacegroup spacegroup\_name - set the spacegroup, e.g. P21
- -cell a,b,c, $\alpha$ , $\beta$ , $\gamma$  - set the cell constants
- -small\_molecule - don't run things like TRUNCATE

# What did it do? and why?

# Indexing

- Initial indexing with LABELIT from 3 images<sup>9</sup>
- Refine results with XDS indexing
- Use data based on general analysis @ 0, 45, 90 degrees

---

<sup>9</sup>This is *not* good for small molecule data

# Integration

- Integrate with lattice constraints applied
- Integrate to corners of detector
- If good reason, repeat integration e.g. with results of postrefinement
- Perform postrefinement in P1, assumed lattice - may reject lattice, feed back to indexing
- At the end of this we have LATTICE
- If XDS, includes iterative elimination of outliers in CORRECT step

# Scaling

- Compare results of pointless with remaining allowed lattices:
  - If agree, proceed
  - If lattice not allowed, consider next solution
  - If solution lower symmetry than lattice, reject and return to indexing
- Ensure conclusions consistent
- Now have correct LAUE GROUP
- Ensure consistent setting / origin choice
- Place data into data collection order
- Analyse absences to decide likely SPACE GROUPs
- Decide scaling model<sup>10</sup>

---

<sup>10</sup>For XDS use not corrections in CORRECT, apply all corrections in XSCALE

# Merging and analysis

- If using XDS for integration and XSCALE for scaling, data still merged with SCALA / AIMLESS
- Resolution limits calculated from the intensities, not program output
- “Downstream” analysis (e.g. TRUNCATE and SFCHECK) identical

# Merging and analysis

- If using XDS for integration and XSCALE for scaling, data still merged with SCALA / AIMLESS
- Resolution limits calculated from the intensities, not program output
- “Downstream” analysis (e.g. TRUNCATE and SFCHECK) identical
- Working on scaling data direct from XDS with AIMLESS

# Decision making

# Indexing - LABELIT

# Testing lattice choice

- Perform postrefinement (MOSFLM and XDS) in P1 and putative lattice
- Compare R.M.S. deviation of observed / predicted centres
- Results comparable → lattice probably OK
- Results worse with lattice constraints → lattice probably wrong

# Testing lattice choice 1

REFINED PARAMETERS: DISTANCE BEAM ORIENTATION CELL AXIS  
USING 27389 INDEXED SPOTS  
STANDARD DEVIATION OF SPOT POSITION (PIXELS) 1.28  
STANDARD DEVIATION OF SPINDLE POSITION (DEGREES) 0.23

...

SPACE GROUP NUMBER	75				

# Lattice observations

- Selecting lattice from indexing safe, as tested and challenged
- However strong argument for performing all processing in P1:
  - Processing only performed once
  - Incorrect constraints cannot break things
  - Results generally comparable
- This is on the to-do list...

# Resolution limits - default criteria

- Merged  $\frac{I}{\sigma_I} > 2$
- Unmerged  $\frac{I}{\sigma_I} > 1$
- Control with -misigma, -isigma

# Resolution limits

11

# Which options work best?

- It depends ...
- ... try for yourself!

# Which options work best?

- It depends ...
- ... try for yourself!
- Sometimes -2d (MOSFLM / SCALA) works better, sometimes -3d (XDS etc.)

# Which options work best?

- It depends ...
- ... try for yourself!
- Sometimes -2d (MOSFLM / SCALA) works better, sometimes -3d (XDS etc.)
- Run both - compare results, make up your own mind

# Which options work best?

- It depends ...
- ... try for yourself!
- Sometimes -2d (MOSFLM / SCALA) works better, sometimes -3d (XDS etc.)
- Run both - compare results, make up your own mind
- Hint for small molecule: -3dii -small\_molecule

# Conclusions

- System available which can reduce your data on your behalf
- Relies on your software: MOSFLM / LABELIT / CCP4 / XDS
- Handles complex strategies so use them
- Works on Windows / OS X / Linux / laptop / workstation / cluster

# Conclusions

- Best way to learn data reduction is to teach it
- Computer is very dim but diligent pupil
- Have a go yourself, or feel free to contribute to xia2
