# 1 Background

Users of macromolecular crystallography (MX) are well served in terms of data reduction software, with packages such as HKL2000, Mosflm<sup>1</sup>, XDS<sup>2</sup> and d\*TREK generally available and commonly used. In the main, however, these programs require that the user makes sensible decisions about the data analysis to ensure that a useful result is reached. This manual describes a package, xia2, which makes use of some of the aforementioned software to reduce diffraction data automatically from images to scaled intensities and structure factor amplitudes, with no user input.

In 2005, when the xia2 project was initiated as part of the UK BB-SRC e-Science project e-HTPX, multi-core machines were just becoming common, detectors were getting faster and synchrotron beamlines were becoming brighter. Against this background the downstream analysis (e.g. structure solution and refinement) was streamlined and the level of expertise needed to use MX as a technique was reducing. At the same time mature software packages such as Mosflm, Scala<sup>3</sup>, CCP4<sup>4</sup> and XDS were available and a new synchrotron facility was being built in the UK. The ground was therefore fertile for for the development of automated data reduction tools. Most crucially, however, the author was told that this was impossible and a waste of time - sufficient motivation for anyone.

# 2 Acknowledgements

Without the trusted and capable packes Mosflm, CCP4, Scala and XDS it would clearly be impossible to develop *xia2*. The author would therefore like to thank Andrew Leslie, Harry Powell, Phil Evans, Wolfgang Kabsch and Kay Diederichs for their assistance in using their programs and modifications they have made. In addition, more recent developments such as Labelit <sup>5</sup>, Pointless<sup>6</sup> and CCTBX<sup>7</sup> have made the development of *xia2* much more

<sup>&</sup>lt;sup>1</sup>A.G.W. Leslie, Acta Cryst. (2006) D62, 48-57

<sup>&</sup>lt;sup>2</sup>W. Kabsch, Acta Cryst. (2010) D66, 125-132

<sup>&</sup>lt;sup>3</sup>P. Evans, Acta Cryst. (2006) D62, 72-82

<sup>&</sup>lt;sup>4</sup>CCP4, Acta Cryst. (1994) D50, 760-763

<sup>&</sup>lt;sup>5</sup>N.K. Sauter et al. J. Appl. Cryst. (2004) 37, 399-409

<sup>&</sup>lt;sup>6</sup>P. Evans, Acta Cryst. (2006) D62, 72-82

<sup>&</sup>lt;sup>7</sup>R.W. Grosse-Kunstleve et al. J. Appl. Cryst. (2002) 35, 126-136

straightforward and the end product. The author would therefore like to additionally thank Nick Sauter and Ralf Grosee-Kunstleve for their help.

Development of a package such as this is impossible without test data, for which the author would like to thank numerous users, particularly the Joint Centre for Structural Genomics, for publishing the majority of their raw diffraction data.

During the course of xia2 development the project has been supported by the UK BBSRC through the e-HTPX project, the EU Framework 6 through the BioXHit project and most recently by Diamond Light Source. The software itself is open source, distributed under a BSD licence, but relies on the user having correctly configured and licenced the necessary data analysis software, the details of which will be discussed shortly.

# 3 Introduction

In a nutshell, xia2 is an expert system to perform X-ray diffraction data processing on your behalf, using your software with little or no input from you. It will correctly handle multi-pass, multi-wavelength data sets as described later but crucially it is not a data processing package. Specifically, if you use xia2 in published work please include the references for the programs it has used, which are printed at the end of the output.

The system was initially written to support remote access to synchrotron facilities, however it may prove useful to anyone using MX, for example:

- assisting new or novice users,
- giving a second opinion to experts,
- assisting busy users to allow them to focus on problem cases, or
- providing reproducible processing.

The last of these may be most useful for users in a pharmacutical setting, or people wishing to test or benchmark equipment, for example beamline scientists. In all cases however the usage of the program is the same.

# 4 Using xia2

The program is used from the command-line, there is no GUI. In essence there are four command-line options which are useful on a daily basis:

- -atom X tell xia2 to separate anomalous pairs i.e.  $I(+) \neq I(-)$  in scaling
- -2d tell xia2 to use MOSFLM and SCALA
- -3d tell xia2 to use XDS and XSCALE
- -3dii tell xia2 to use XDS and XSCALE, indexing with peaks found from all images

These specify in the broadest possible terms to the program the manner in which you would like the processing performed. The program will then read all of the image headers found in /here/are/my/data to organise the data, first into sweeps, then into wavelengths, before assigning all of these wavelengths to a crystal.

#### [FIXME FIGURE]

The data from the experiment is understood as follows. The SWEEP, which corresponds to one "scan," is the basic unit of indexing and integration. These are contained by WAVELENGTH objects which correspond to CCP4 MTZ datasets, and will ultimately have unique Miller indices. For example, a low and high dose pass will be merged together. A CRYSTAL however contains all of the data from the experiment and is the basic unit of data for scaling.

# 5 Introductory example

The most straightforward way to discuss the operation of the program is through demonstrations with real examples. The first of these is a DNA / ligand complex recorded at Diamond Light Source as part of ongoing research. The structure includes barium which may be used for phasing, and the data were recorded as a single sweep. As may be seen from [FIXME FIGURE] the quality of diffraction was not ideal, and radiation damage was an issue. Initially the data were processed with

giving the merging statistics shown in [FIXME TABLE]. From these it is clear that there is something wrong: it is very unusual to have near atomic resolution diffraction with  $\sim 10\% R_{\rm merge}$  in the low resolution bin. The most likely reasons are incorrect assignment of the pointgroup and radiation damage - the latter of which is clear from the analysis of  $R_{\rm merge}$  as a function of image number [FIXME FIGURE.] A development option is now available

# 5.1 Modifying input

From the example it would seem sensible to investigate processing only the first 200 of the 450 images. While it is usual to limit the batch range in scaling when processing the data manually, xia2 is not set up to work like this as decisions made for the full data set (e.g. scaling model to use) may differ from those for the subset - we therefore need to rerun the whole xia2 job after modifying the input. All that is necessary is to adjust the image range (START\_END) to get the modified input file shown in FIXME FIGURE and rerun as

# xia2 -3d -xinfo modified.xinfo

giving the results shown in FIXME TABLE. These are clearly much more internally consistent and give nice results from experimental phasing. At the same time we may wish to adjust the resolution limits to give more complete data in the outer shell, which may be achieved by adding a RESOLUTION instruction to either the SWEEP or WAVELENGTH block.

# 6 Program Output

As the program runs the key results are written to the screen and recorded in the file xia2.txt. This includes everything you should read and includes appropriate citations for the programs that xia2 has used on your behalf. There is also a file xia2-debug.txt which should be send to xia2.support@gmail.com in the event of program failure. There are also two sensibly named directories, LogFiles and DataFiles, which will be discussed shortly.

#### 6.1 xia2.txt

In intention of the program output from xia2 is that it includes only the information which is critical to read, as will be shown for a 450 image Pilatus 2M data set recorded from a Thaumatin crystal. The results from indexing are displayed as lattice / unit cell:

```
----- Autoindexing SWEEP1 ------

                            89.93
                                  90.00
  57.59 57.61 149.52 89.93
                            89.99
Indexing solution:
   57.60 57.60 149.51 90.00 90.00 90.00
```

where in each case the solution with the lowest penalty is displayed. The results of integration are displayed as one character per image - which allows the overall behaviour of the data to be understood at a glance. While mostly 'o' is usually a good indication of satisfactory processing, '%' are not unusual, along with '.' for weaker data. If the output consists of mostly 'O' then it may be helpful to record a low dose data set. The output looks like:

```
----- Integrating SWEEP1 ------
Processed batches 1 to 450
Weighted RMSD: 0.26 (0.09)
Integration status per image (60/record):
"o" => good
      "%" => ok
             "!" => bad rmsd
"O" => overloaded "#" => many bad "." => blank
"@" => abandoned
Mosaic spread: 0.140 < 0.189 < 0.290
```

## 7 Old stuff

#### 7.1 Example: 3QRN

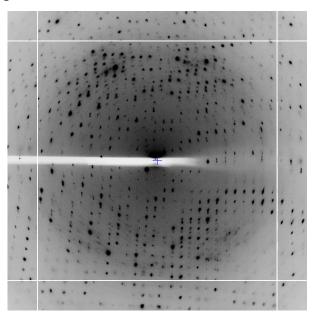

and includes a convenient legend.

Mosaic spread: 0.140 < 0.189 < 0.290
```

# 7.15 Options (2)

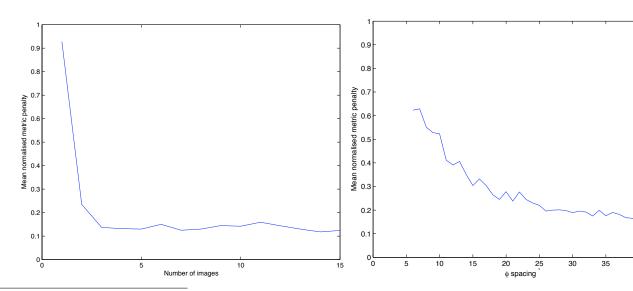

- -xinfo modified.xinfo use specific input file
- -image /path/to/an/image.img process specific scan
- -spacegroup spacegroup\_name set the spacegroup, e.g. P21
- $\bullet$  -cell a,b,c,  $\alpha,\beta,\gamma$  - set the cell constants
- -small\_molecule don't run things like TRUNCATE

# 8 What did it do?

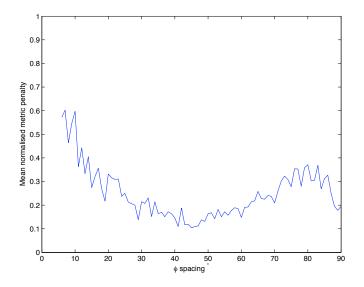

# What did it do? and why?

# 8.1 Indexing

- Initial indexing with LABELIT from 3 images<sup>8</sup>
- Refine results with XDS indexing
- Use data based on general analysis @ 0, 45, 90 degrees

 $<sup>^8</sup>$ This is not good for small molecule data

# 8.2 Integration

- Integrate with lattice constraints applied
- Integrate to corners of detector
- If good reason, repeat integration e.g. with results of postrefinement
- Perform postrefinement in P1, assumed lattice may reject lattice, feed back to indexing
- At the end of this we have LATTICE
- If XDS, includes iterative elimination of outliers in CORRECT step

# 8.3 Scaling

- Compare results of pointless with remaining allowed lattices:
  - If agree, proceed
  - If lattice not allowed, consider next solution
  - If solution lower symmetry than lattice, reject and return to indexing
- Ensure conclusions consistent
- Now have corrrect LAUE GROUP
- Ensure consistent setting / origin choice
- Place data into data collection order

- Analyse absences to decide likely SPACE GROUPs
- Decide scaling model<sup>9</sup>

# 8.4 Merging and analysis

- If using XDS for integration and XSCALE for scaling, data still merged with SCALA / AIMLESS
- Resolution limits calculated from the intensities, not program output
- "Downstream" analysis (e.g. TRUNCATE and SFCHECK) identical
- $\bullet$  Working on scaling data direct from XDS with AIMLESS

### 9.6 Decisions: Lattice observations

- Selecting lattice from indexing safe, as tested and challenged
- However strong argument for performing all processing in P1:
  - Processing only performed once
  - Incorrect constraints cannot break things
  - Results generally comparable
- This is on the to-do list...

# 9.7 Resolution limits - default criteria

- Merged  $\frac{I}{\sigma_I} > 2$
- Unmerged  $\frac{I}{\sigma_I} > 1$
- $\bullet\,$  Control with -misigma, -isigma

# 9.8 Resolution limits - why unmerged $\frac{I}{\sigma_I} > 1$ ?

 $^{10}$  Though resolution lim-

its to need to be revisited...

# 10 Comments

# 10.1 Which options work best?

- It depends ...
- ... try for yourself!
- Sometimes -2d (MOSFLM / SCALA) works better, sometimes -3d (XDS etc.)
- Run both compare results, make up your own mind
- Hint for small molecule: -3dii -small\_molecule
- $\bullet$  -3d often works better for very fine  $\phi$  sliced Pilatus data

 $<sup>^{10}90\</sup>text{-fold}$  multiplicity data from Ed Mitchell @ ESRF

# 11 Conclusions

#### 11.1 Conclusions

- System available which can reduce your data on your behalf
- Relies on your software: MOSFLM / LABELIT / CCP4 / XDS
- Handles complex strategies so use them
- Works on Windows / OS X / Linux / laptop / workstation / cluster
- Best way to learn data reduction is to teach it
- Computer is very dim but diligent pupil
- Have a go yourself, or feel free to contribute to xia2

# 11.2 Getting xia2

• Blog: xia2.blogspot.com

• Code: xia2.sf.net
